PROFESSIONAL SUMMARY

Full-Stack Developer with hands-on experience building mobile, backend, and IoT systems. Proficient in React Native (offline-first architecture), Node.js/Django APIs, BLE/MQTT real-time pipelines, and cloud deployments on AWS. Adept at event-driven microservices, and time-series data with InfluxDB. Experienced with AI-assisted development tools (Claude Code, Cursor, GitHub Copilot) and delivering end-to-end features at high velocity.

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript, Java
Frontend & Mobile: React 18, React Native, NextJs
Backend: Node.js (Express), Django, Spring Boot
Databases: PostgreSQL, MySQL, MongoDB, Redis, SQLite, InfluxDB
Event-Driven / Messaging: NAT, MQTT, pub/sub patterns, async microservices, WebSocket
Offline-First & Sync: WatermelonDB/SQLite, CRDT-based conflict resolution, background sync
DevOps & Infra: Docker, GitHub Actions, Kubernetes basics, Dockploy, Firebase
Cloud: AWS Lambda, SQS, EventBridge, EC2, BeanStalk, IAM, RDS, S3
Tools: Android Studio, Xcode, Git, Grafana, Alexa Skills Kit, Claude Code, Cursor, OpenCode

EXPERIENCE

Software Engineer (Full Stack) | Veblika, Noida *Jun 2026 – Present*

- Designed a hybrid execution architecture capable of running workflow logic on **AWS Lambda (serverless)** or **Redis-backed worker services** using the same codebase.
- Built a metadata-driven workflow engine supporting configurable Actions, Triggers, Conditions, and business rules without changing application code.
- Optimized workflow execution and background processing to improve scalability and system reliability.
- Developed and maintained a Django-based Travel Agency Management System enabling travel agents to manage customers, travel bookings, payments, credit notes, and daily business operations from a centralized platform.
- Built a reminder and **notification system** allowing travel agents to **schedule** reminders that automatically notified both agents and customers at the appropriate time.

Software Engineer (Full Stack) | EVI Technologies, New Delhi *Aug 2024 – May 2026*

- Designed and built microservices-style backend APIs integrating firmware/hardware teams with mobile applications for reliable real-time data exchange over BLE and MQTT protocols.
- Architected a real-time IoT pipeline using MQTT, AWS, and Grafana enabling live sensor monitoring; implemented time-series storage with InfluxDB for charger energy and session data.
- Integrated EV chargers with Amazon Alexa via Alexa Skills Kit, enabling voice control and real-time status updates within smart home ecosystems.
- Delivered BLE-based direct device control for EV chargers, reducing command response time by ~80% using low-latency pub/sub communication patterns.

- Built a Git-inspired reliable data sync engine with conflict resolution (CRDT-like approach), cutting data conflicts and sync failures by ~70% and improving field-to-cloud consistency.
- Leveraged AI-assisted coding tools (Claude Code, Cursor, GitHub Copilot) to ship features at high velocity across the full stack.
- Developed CI/CD pipelines using GitHub Actions to automate React Native mobile app deployments to Firebase App Distribution for testing and Google Play Store for production releases.

Software Engineering Intern | EVI Technologies, New Delhi *Nov 2023 – Jul 2024*

- Contributed to React Native mobile app (offline-first architecture) and Django REST API backend for EV charger management platform.
- Implemented background synchronization and local SQLite storage for field data capture in low-connectivity environments.
- Built real-time UI dashboards for charger status, energy usage, and session metrics using WebSocket and live data feeds.

PROJECTS

Medical Device Analysis Application — *React Native, Django, React, SQLite, BLE*

- Built a hardware-integrated mobile application capturing and processing medical scan data from screening devices over Bluetooth.
- Applied offline-first architecture (SQLite + background sync) for consistent data capture in field environments — analogous to WatermelonDB patterns.
- Enhanced real-time visualization features for abnormal pattern detection.

EV Charger Mobile Application — *React Native, Django, Expo, BLE, WebSocket*

- Built full-featured mobile app to control EV chargers — start/stop charging, real-time status monitoring, and session control using BLE Low Energy communication.
- Implemented real-time UI updates for energy usage, charger status, and session data using WebSocket, improving user interaction and control visibility.
- Designed offline-capable local storage layer ensuring uninterrupted UX in connectivity-limited environments.

Smart EV Charging Load Optimization System — *Java, Spring Boot, MySQL, WebSocket, Docker*

- Built a microservices-style system to dynamically adjust EV charging current based on real-time household power consumption data from energy meters.
- Integrated charger platform with energy meter telemetry to monitor available load and prevent circuit overload — analogous to SCADA/time-series data processing.
- Containerized with Docker; used WebSocket for real-time bidirectional communication between services.

Hardware Configuration & Monitoring Tool — *Python, USB Serial, Multi-threading*

- Developed a multi-threaded desktop application to configure embedded devices via USB serial communication with real-time logging and monitoring.
- Designed structured state machine logic for device configuration workflows — applicable to RFI/NCR approval chains and workflow engines.

EDUCATION

Master of Computer Applications (MCA) | IGNOU, India *2025 – Ongoing*

Bachelor of Computer Science (CGPA: 8.21) | Aryabhatta College, University of Delhi, India *2021 – 2024*
